

## Dice tower assembly guide

### Base Section:

Layout the base pieces to ensure correct orientation before gluing, make sure the corners align properly as in the picture.

Add a small amount of glue in ALL of the cutout areas of the base and the edges of the side pieces, see pic for example. Assemble carefully, pressing together to close any gaps and then wipe off any surplus glue.

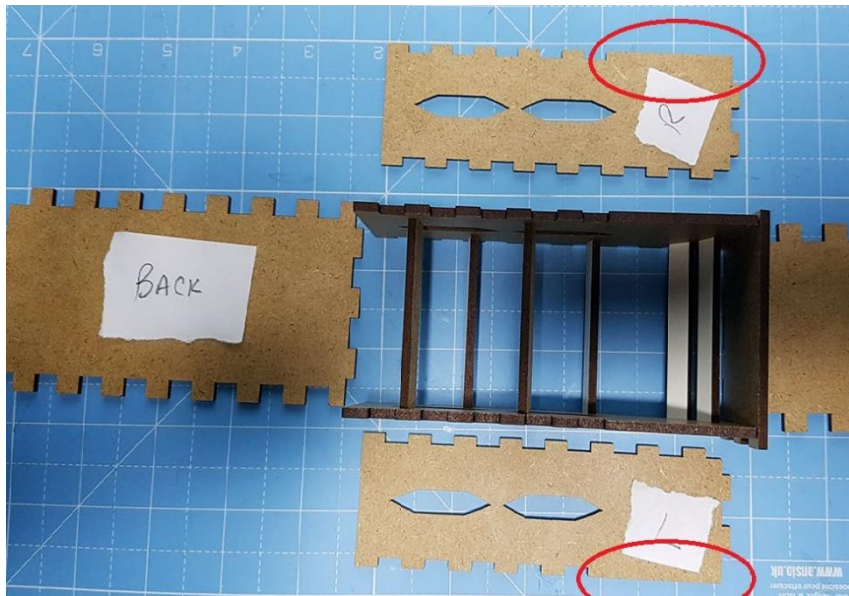

### Tower section:

Same procedure as the base, layout the tower pieces first to ensure they are properly located.

#### Note

1. The Left and right side pieces are double layered. There are small rectangular cutouts on the inside pieces for the tumble rails. These will be hidden by the outside pieces when assembled.
2. When assembled correctly the straight edges circled will be at the front of the tower

I found it easier to glue the two left side pieces to the back first, then assemble the right inner piece so that the tumble strips can be fitted. Followed by the outer right side. Then followed by the base piece and the front

Add a small amount of glue in ALL of the cutout areas as performed for the base. Assemble carefully, wipe off any surplus glue.

Wait until both the tower and the base have properly dried before assembling to make sure they don't stick together.
